### GENERAL DATA

#### NOTES ON UNI EN 12845

UNI EN 12845, the Italian version of European Standard EN 12845, sets the design, installation and maintenance criteria for sprinkler systems. It replaces the earlier Italian standards UNI 9489 and UNI 9490. An automatic sprinkler system is designed to detect the presence of fire and extinguish it during the initial stages, or to keep flames under control until they can be extinguished fully using other means. The classic sprinkler system is composed of: a water source, a fire-fighting pump unit, a series of control valves, and a sprinkler circuit. In its basic execution, it consists of: one or more 4", 6", or 8" submerged electric pumps, plus the 4" compensation pump (jockey), if required.

#### COMPOSITION OF THE PUMP SETS

The pumps of UNI EN 12845 sets will have the same characteristics; in addition:

- if TWO pumps are installed, each pump must deliver the total system load (100 %),
- if THREE pumps are installed, each pump must deliver 50 % of the load required by the design.

#### NOTE:

**In case of single water supply, there are no limitations on the number of electric pumps that can be installed. DAB provides "modular" type sets, so that all the versions contemplated by the UNI EN 12845 standard - OPERATION OF UNI EN 12845 FIRE-FIGHTING PUMP SETS - can be completed.**

In normal conditions, (zero water request), the system is under static pressure. The first time there is a water request, the compensation pump activates (if present), reinstating the system pressure. In case of significant water request (or if no compensation pump is installed, or the sprinklers activate), the pressure drops until the two pressure switches connected in series activate the main pump. If the pressure continues to drop, further pumps activate in the same way.

Pressure switch calibration and operation example.

	Maximum pump pressure x 0,8	
Two-pump sets	Pump 1 Max pressure x 0,8	Pump 2 Max pressure x 0,6

**E.g. Max pump pressure 10 bar - pump 1 starts at 8 bar, pump 2 starts at 6 bar**

Once activated, the main pump continues to operate until it is manually stopped using the STOP pushbutton on the electric control panel.

No protections for stops due to lack of water are permitted. In case of hydrant systems, refer to UNI 10779 - July 07. In addition to prescribing feed pumps in compliance with UNI EN 12845, UNI 10779 allows automatic stopping of the pumps 20 minutes after the closing of the hydrants, in case of non-permanently supervised operation. DAB pump sets are suitable for sprinkler systems with manual stop, and for hydrant systems with automatic stop.

### PRESSURE COMPENSATION PUMP - "JOCKEY"

The compensation pump (jockey) is a pump that intervenes when the collection of a small amount of water is required. This avoids pointless starts of the main pumps in case of small system leaks. DAB fire-fighting sets are available with and without jockey pump.

The compensation pump must be installed at the delivery manifold, and includes:

- ball valve on the suction,
- check ball valve on the delivery,
- control pressure switch,
- 20 litre expansion vessel.
- control and protection panels

### CONSTRUCTION FEATURES

Technopolymer impellers with stainless steel wearing parts, fitted on floating clearance rings made of synthetic low abrasion material, and technopolymer diffusers that impart significant wear resistance to the pump. Pump liner, shaft and coupling, strainer and cable sheath in stainless steel. Base support and upper head in microcast AISI 304 stainless steel; steel check valve incorporated in the head (to be removed for horizontal installation).

#### CONSTRUCTION FEATURES OF THE 6" PUMPS

Motor and delivery body support in rust-proof spheroidal cast iron (Niresist D2B). Bottom support sized according to NEMA 6" standard. Check valve incorporated in the delivery support (to be removed for horizontal installation) Bushing bearings: bronze - rubber. Completely protected splined shaft (AISI 420). Wear rings, stage box, cable sheath, suction grid in stainless steel (AISI 304). Noryl impellers and diffusers.

#### CONSTRUCTION FEATURES OF THE 8" PUMPS

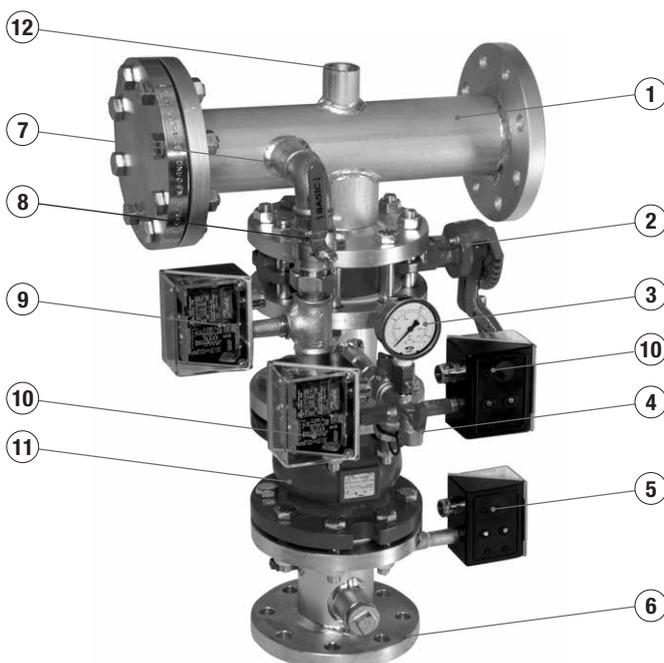

Multistage semiaxial submersible electric pumps for wells measuring 8" or above, able to generate a broad range of flow rates and heads. Pump body in cast iron with paint coating, impellers in cast iron. Dynamically balanced impellers coupled on the shaft with pull tab. Shaft guided with coaxial bush bearings and fully protected with bushes. Pump with low pressure loss check valve (to be removed for horizontal installations). Threaded delivery port with reduced flange. Possible horizontal installation.

### COOLING LINERS FOR 4" SUBMERSIBLE PUMP

For horizontal installation and/or inside tanks, a cooling liner must be used to safeguard the motor.

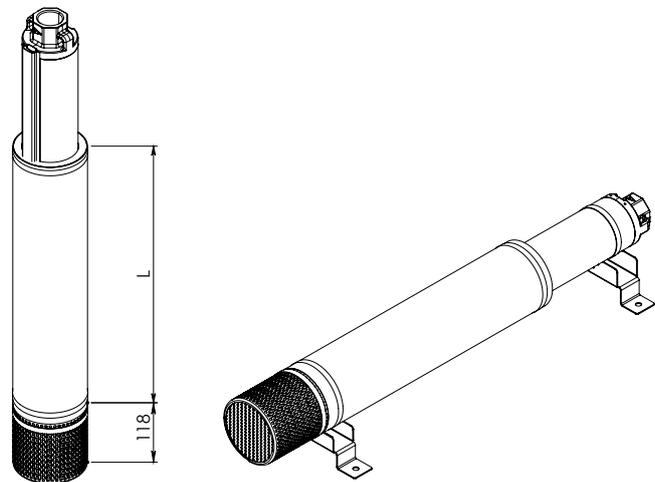

Kit of cooling liners of different lengths, used to ensure perfect cooling of the 4" motor in case of installation inside tanks or containers, or in any location where a minimum cooling flow on the motor cannot be guaranteed.

The length of the pipe must be selected based on the type of motor and its power, as indicated in the following table.

The length of the pipe must be selected based on the type of motor and its power, as indicated in the following table.

in order to determine the cooling flow speed  $v$  [m/s] along the motor liner, the following formula can be used:

$$v = \frac{\frac{Q}{2}}{\pi \cdot \left( \frac{D^2}{4} - \frac{d^2}{4} \right)}$$

On the other hand, in order to determine the correct diameter of the cooling liner, to ensure that the minimum required cooling flow condition is met at a certain pump flow level, the following formula can be used:

$$D = \sqrt{4 \cdot \left( \frac{Q}{v \cdot \pi} + \frac{d^2}{4} \right)}$$

$Q$  [m<sup>3</sup>/s] = flow at the point of operation of the electric pump.  
 $D$  [m] = well diameter.  
 $d$  [m] = motor diameter.  
 $v$  [m/s] = cooling flow speed.
